

# Open Question

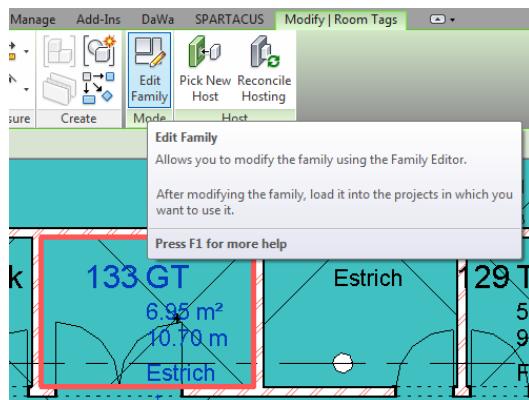

**How can I get the referred element parameter of TextElements using Revit API?**

The topic is about TextElements, in Family context.

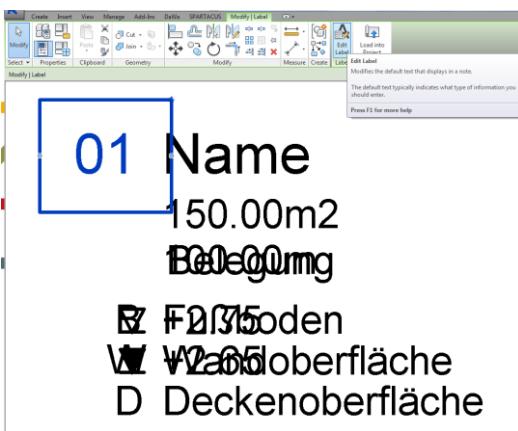

If you create a label family, you want to display certain parameters of a family instance.

A user could change the referred parameter in this way:

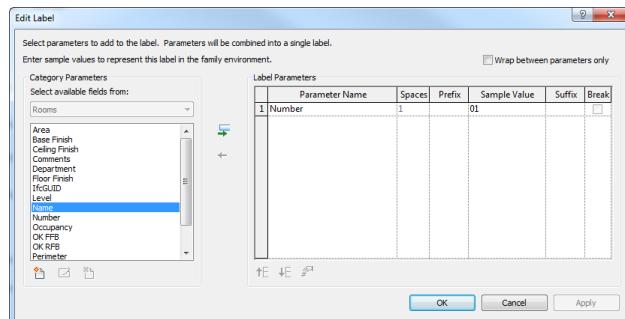

1. Select a tag family and click "Edit Family"

2. Select a TextElement (f.e. 01 - Mark)

3. Select parameters as Label Parameter

**There should a way to get or set the label parameters of a label in the same way using the API!**

**In the best case:** There should be a way to get the label parameters of a label tag without opening the label family because when the family editor was opened the project context get lost!

We need this requirement to get the values on a label parameter in the project context.
