Spread footings - Punching

Hi,

I can't figured out how Robot calculate the punching in a spread footing. The code is EN1992-1.

## Perfuração

Combinação do projeto ULS: 1.35DL1

Fatores de carga: 1.35 \* Peso da fundação

1.35 \* Peso do solo

Carga de projeto:

Nr = 778,48595 (kN) Mx = -0,00000 (kN\*m) My = 0,00000 (kN\*m)

Comprimento da circunferência crítica: 4.70 (m)

Força de punção: 493,09910 (kN)
Altura de seção efetiva neff = 0,43 (m)

How in Robot the punching force id 493.099 kN on the critical perimeter 4,70.

Any help would be greatly appreciated.

Thanks

A.Santos (Portugal)
