

I populate my text styles by copying (^C) my preferred text styles from a folder called styles into the drawing and then delete them all. The styles are created on the zero-layer.

I copy my objects from a similar folder where all the objects are on a zero layer. I then move the object onto the wanted layer.

I do my writing on TEXT layer. All my models are drawn on the zero layer and I create polylines on named layers then delete the zero lines at the end of the drawing.

I always purge on completion (not in this case).

I then create a blank layer (layout2) and then publish the two layouts so as to get the layer options in the pdf. I then edit the pdf to delete the last page.

SECOND EXAMPLE
