

SRTM 1arcsec  
30m DEM

Limit of Lidar  
Surface

Edge of LIDAR vs SRTM surface  
interface produces large elevation  
differences. Particularly in steep  
forested areas.

Require a tool that will allow blending of different surface edges. Allow criteria to hold edge of surface A and blend into surface B by distance or slope or average both sides over a buffer width. Also allow ability to apply blending criteria to different ranges/areas.
