During the installation of Map 2014 I specified a License type of Network.

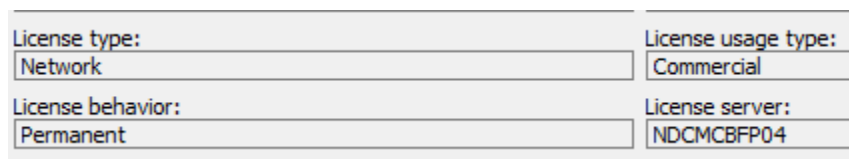

I selected to use a Distributed License Server:

I added the following servers to the list:

When I start Map and check the License Server being used it points at the server which is first on my list:

ADSKFLEX_LICENSE_FILE=@NDCMCBFP04;@NDCMCBFU04;@NDCMCBFD01

The odd thing is that I'm running a license manager on this server, (NDCMCBFP04) the service and license file is for Map 2010 not Map 2014

The server I'm trying to authenticate against is NDCMCBFD01 which is last on the list and does contain a functioning FlexNET installation and license.

Is this as simple as changing the order of servers listed in the ADSKFLEX_LICENSE_FILE variable?
