using centre line bisector only works for single lines not chains of multiple line arc combinations. Thus when combining lines and arcs, the centre line bisector is not continuous

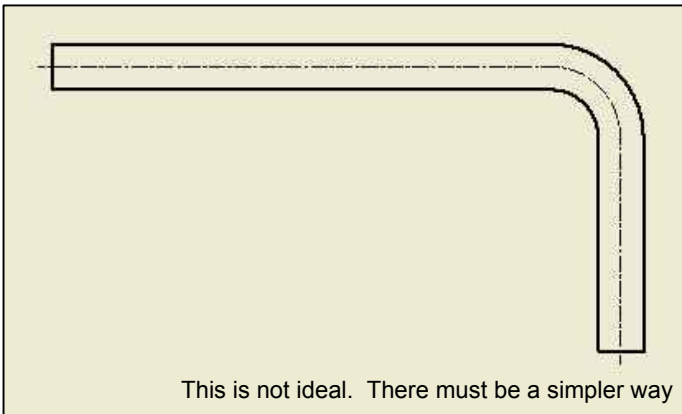

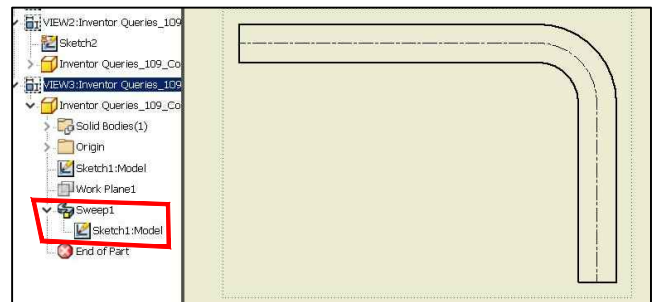

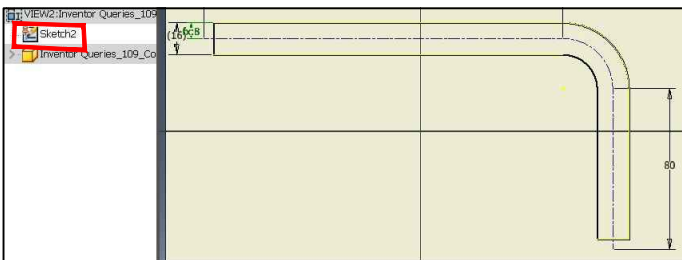

and cannot be joined by dragging

The work around I have found is to create the continuous centre line using sketch, offset, dimensioning and changing linetype

The other work around I have found is to retrieve the model sketch of the path for the sweep, and change the properties of the line to chain. You however don't get the extension beyond the edges in this case

This is not ideal. There must be a simpler way
